What problem does this PR solve?

Unnecessary memory occupation when the server is in idle state.

What is changed and how it works?

- `tcmalloc`'s memory release rate is set to 10 (maximum) while providing customization.
- Periodic memory release using `tcmalloc`'s extension. The current releasing period is 100 seconds.

Check List

Tests

- Unit test

Code changes

- Has exported function/method change
- Has exported variable/fields change

Side effects

- Possible performance regression
